ABSTRACT

The ventral posterior hypothalamus (VPH) is an anatomically complex brain region implicated in arousal, reproduction, energy balance and memory processing. However, neuronal cell type diversity within the VPH is poorly understood, an impediment to deconstructing the roles of distinct VPH circuits in physiology and behavior. To address this question, we employed a droplet-based single cell RNA sequencing (scRNA-seq) approach to systematically classify molecularly distinct cell types in the mouse VPH. Analysis of >16,000 single cells revealed 20 neuronal and 18 non-neuronal cell populations, defined by suites of discriminatory markers. We validated differentially expressed genes in a selection of neuronal populations through fluorescence *in situ* hybridization (FISH). Focusing on the mammillary bodies (MB), we discovered transcriptionally-distinct clusters that exhibit a surprising degree of segregation within neuroanatomical subdivisions of the MB, while genetically-defined MB cell types project topographically to the anterior thalamus. This single cell transcriptomic atlas of cell types in the VPH provides a detailed resource for interrogating the circuit-level mechanisms underlying the diverse functions of VPH circuits in health and disease.

accepted for publication at *eLife* (Mickelsen, Flynn, ... Robson, Jackson) 'Cellular taxonomy and spatial organization of the murine ventral posterior hypothalamus' doi: 10.7554/eLife.58901

Method

VASC: Dimension Reduction and Visualization of Single-cell RNA-seq Data by Deep Variational Autoencoder

Dongfang Wang^a, Jin Gu^{a,b}✉

MOE Key Laboratory of Bioinformatics, BNRIST Bioinformatics Division & Center for Synthetic and Systems Biology, Department of Automation, Tsinghua University, Beijing 100084, China

Received 23 March 2018, Revised 9 July 2018, Accepted 8 August 2018, Available online 18 December 2018.

Figure 2. Visualization of scRNA-seq datasets using different methods

Each data point represents a cell. Different cell types are indicated in different colors and shapes. All datasets were run by PCA, t-SNE, ZIFA, SIMLR, and VASC respectively. Cell type information was retrieved from original studies. Shown in the figures are clustering output from the Goolam [22] (A), Biase [18] (B), Yan [30] (C), Pollen [27] (D), Kolodziejczyk [24] (E), and Baron_human-1 [17] (F) datasets. Visualization of other datasets is provided in the Section 4 of File S1. PCA, principal components analysis; t-SNE, t-distributed stochastic neighbor embedding; ZIFA, zero-inflated factor analysis; SIMLR, single-cell interpretation via multiple kernel learning.

The "Baron" dataset contains a large number of cells from human and mouse pancreas. Totally, there are 4 human donors with 1937, 1724, 3605, and 1303 cells, and 2 mice with 822 and 1064 cells, respectively

Important Figures on the Path to Darwin

Figure	Birth Date	Death Date	Time of Relevance	Rationale for Time of Relevance	Idea/Discovery/Relevance
Anaximander of Miletus	-610	-546	-605	Around when "On Nature" poem was published. No exact dates, I'm just guessing	proposed that the first ever animals lived in water and that the first land-dwelling ancestors of mankind must have been born in water and spent some time on land. Associated humans with fish but they also required nurse!
Pythagoras	-570	-495	-550	Estimate provided by link for sperm/performationism	"likeness" and spermism: an obsolete biological theory that stated that sperm contained the preformed germs that develop into miniature versions of themselves.
Democritus	-460	-370	-400	Atomism	Believed in eternal change (subatomic particles), birth and death in animals are just the mingling and separating of atoms.
Plato	-428	-347	-375	Publication of The Republic	"Theory of Form" all forms of life are imperfect copies of an eternal form. Early eugenics? Came up with "Essentialism": Essentialism is the view that every entity has a set of attributes that are necessary to its identity and function. Wrote about this in "The Republic". Perfection must already exist in another dimension. What we see in the other dimension, is a mere reflection of perfect realities in that other dimension (like how you can imagine a perfect horse in the other dimension, => if something is changeable towards perfection, then it is not perfect to be with incompatible with the idea of progressive change with a selective force.
Aristotle	-384	-322	-375	ESTIMATE: Generations of Aristotle was published in the "later part of the fourth century B.C." (source)	Perfect forms do exist as extrapolations of our imagination. We create perfection in our own minds and we from nature, recognized a close connection between an organism's form and function (what we call "design" attribute to any divine cause. Inspired the dominant belief in the middle ages of the "Great Chain of Being" "Generations of Animals"
Zhuang Zhou	-369	-286	-290	B. On the Generation of An.	embryo.asu.edu said that biological species were not fixed and could change over time, in resp m regarded human nature and the heavens

TEN QUESTIONS TO ASK WHEN CREATING A VISUALIZATION

The 10 Questions

1. **Who** | Who is your audience? How expert will they be about the subject and/or display conventions?
2. **Explore-Explain** | Is your goal to explore, document, or explain your data or ideas, or a combination of these?
3. **Categories** | Do you want to show or explore pre-existing, known, human-interpretable, categories?
4. **Patterns** | Do you want to identify new, previously unknown or undefined patterns?
5. **Predictions & Uncertainty** | Are you making a comparison between data and/or predictions? Is representing uncertainty a concern?
6. **Dimensions** | What is the intrinsic number of dimensions (not necessarily spatial) in your data, and how many do you want to show at once?
7. **Abstraction & Accuracy** | Do you need to show all the data, or is summary or abstraction OK?
8. **Context & Scale** | Can you, and do you want to, put the data into a standard frame of reference, coordinate system, or show scale(s)?
9. **Metadata** | Do you need to display or link to non-quantitative metadata? (including captions, labels, etc.)
10. **Display Modes** | What display modes might be used in experiencing your display?
